Welcome to Greenplum Performance Monitor 2.0.0

Greenplum Performance Monitor is an optional performance monitoring feature that administrators can install and enable for Greenplum Database. Greenplum Performance Monitor lets administrators view the status and performance of actively running queries and allows for detailed analysis of historical queries and system metrics. A browser-based graphical interface provides easy access to a variety of configurable views and reports on performance data.

Please refer to the following sections for more information about this release:

- Known Issues in Greenplum Performance Monitor 2.0.0
- Installing Greenplum Performance Monitor 2.0.0

Known Issues in Greenplum Performance Monitor 2.0.0

This section lists the customer reported issues that remain unresolved in Greenplum Performance Monitor 2.0.0. Workarounds are provided where applicable.

Table A.1 Known Issues in Greenplum Performance Monitor

Issue Number	Description
3995	**Long-Running Utility Commands not Logged** Utility commands such as CREATE PARTITION that run longer than three times the quantum value are not logged by the monitor. The Greenplum component responsible for executing utility commands has not been instrumented in this release of the monitor.
3913	**Metric for cpu_elapsed not Correctly Logged in Short-Running Queries** When a query runs for a period shorter than `quantum` (default value is 15 seconds), the value for cpu_elapsed may be recorded as zero. This may occur even though the query runs longer than the values for `min_query_time` and `min_detailed_query`, when those values are lower than the value for `quantum`.
3131	**Metrics for cpu_idle Indicate Value Greater than 100%** Because the underlying function for retrieving CPU usage provides percentage values per physical CPU, the total for a dual-CPU system is 200%. This can result in CPU percentage metrics greater than 100% For example, in situations where cpu_user and cpu_sys metrics are low values such as 5%, the cpu_idle value can be 190%.

Installing Greenplum Performance Monitor 2.0.0

These are the high-level steps to install Greenplum Performance Monitor. For detailed instructions, please see the installation chapter of the *Greenplum Perfomance Monitor Guide*.

1. Run the installer on the Greenplum Database master host.

2. Set up the monitor database, master agent and web service on the master host using the `gpperfmon` utility.
3. Install the segment monitor agents.

Greenplum Performance Monitor 2.0.0 Documentation

The following Greenplum Database documentation is available in the `$GPMON_HOME/docs` directory of your Greenplum Performance Monitor installation, or you can go to http://gpn.greenplum.com to download the latest documentation:
